10. DESCRIPTION OF PROPOSED CONSTRUCTION

Perform the following energy conservation and cost-saving retrofits:

- a. Replace two steam boilers with one modular hot water boiler system in Building 506.
- Install chilled water temperature reset controls on three chillers (one in Building 506 and two in Building 2105).
- c. Replace the converted 45-ton glycol chiller for ice-on-coil system at Building 506 with an efficient unit designed for cold-temperature applications.
- d. Install duty cycling controls on four chillers (one in Building 451 and three in Building 3490).
- e. Modify lighting fixtures and install lighting controls as follows:
 - (1) Retrofit fluorescent fixtures with electronic ballasts and T8 lamps in Buildings 451, 506A, 506B, 506C, 2105 and 3490.
 - (2) Retrofit 4-lamp fluorescent fixtures with 3-lamp electronic ballasts, T8 lamps and specular reflectors in Buildings 451, 506B, 2104 and 3490.
 - (3) Replace incandescent fixtures with surface mounted T8 and compact fluorescent fixtures in Buildings 451, 506A and 506B.
- f. Install occupancy sensors (ceiling or wall-switch mounted) in Buildings 451, 506A, 506B, 2105 and 3490.
- g. Install additional explosion-proof light fixture switching in Building 3482.

PROJECT: Implement energy conservation retrofits in six buildings. (Current mission.)

<u>REOUIREMENT</u>: This project will contribute toward achieving Department of Defense facility energy goals of a 20-percent reduction in energy use per gross square feet by FY2000 versus FY1985 baseline levels.

This project will save \$119,952 annually, resulting in a 5.3-year simple payback period and a savings-to-investment ratio of 2.64. The annual energy savings is 3,321 MBTU (3,503,000 MJ) of electricity, 466 MBTU (34,263 MJ) of fuel oil and 578 MBTU (39,543 MJ) of LPG fuel. All buildings and retrofit actions will be in active use throughout the amortization period.

<u>CURRENT SITUATION</u>: Unnecessary energy is currently being consumed for space heating and cooling systems, lighting systems, and generation of domestic hot water in facilities.

<u>IMPACT IF NOT PROVIDED</u>: If this project is not accomplished, an annual energy and operations and maintenance expense of \$119,952 that could be avoided will be incurred.

<u>ADDITIONAL</u>: This project has been coordinated with the installation physical security plan, and no security improvements are required. This project incorporates recommendations of an Energy Engineering Analysis Program, Energy Survey of Boiler and Chiller Plants, performed under Contract No. DACA05-92-C-0155.

This installation is not under consideration for realignment or closure.

RICHARD R. WALKER Colonel, Aviation Commanding

Estimated Construction Start: July 1996 Index: 2119
Estimated Midpoint of Construction: September 1996 Index: 2133
Estimated Construction Completion: November 1996 Index: 2147

LOCATION: Yuma Proving Ground, Arizona

PROJECT TITLE: ECIP Facility Energy Improvements

Detailed Justification

- 1. GENERAL: The project is a significant part of Yuma Proving Ground's effort to achieve a 20-percent reduction in energy consumption by FY2000 versus FY1985 baseline levels.
- 2. ACCOMMODATIONS NOW IN USE: Not applicable.
- ANALYSIS OF DEFICIENCY: Present system designs within the facilities proposed for retrofits account for an unnecessary annual energy and operations and maintenance expense of \$119,952 that could be avoided.
- 4. CONSIDERATION OF ALTERNATIVES: The retrofits included in this project represent all of the economically justified actions potential energy conservation opportunities (ECO's) evaluated in the Energy Survey of Boiler and Chiller Plants that comply with ECIP criteria.
- 5. CRITERIA FOR PROPOSED CONSTRUCTION: Design and construction will be in accordance with criteria established in DOD 4270.1-M and TM810-5.
- 6. PROGRAM FOR RELATED FURNISHINGS AND EQUIPMENT: Not applicable.
- 7. DISPOSAL OF PRESENT ASSETS: Not applicable.
- 8. SURVIVAL MEASURES: Not applicable.
- 9. SUMMARY OF ENVIRONMENTAL CONSEQUENCES: Atmospheric emissions will be reduced because less fuel will be burned as a result of implementation of this project.
- 10. EVALUATION OF FLOOD HAZARDS AND ENCROACHMENT ON WETLANDS: Not applicable.
- 11. ECONOMIC JUSTIFICATION: In accordance with Energy Conservation Investment Program (ECIP) Guidance dated November 1992, an economic analysis has been prepared. Life-cycle cost analysis results are summarized as follows:

• Estimated Construction Cost (including SIOH)	\$599,400
• Annual Energy Savings	(3,577,000 MJ)
• Total First Year Dollar Savings	\$119,952
• Discounted Energy Savings	\$1,300,298
• Discounted Nonenergy Savings	\$369,544
• Total Net Discounted Savings	\$1,669,842
Savings-to-Investment Ratio	2.64

Refer to "Detailed Calculations" for backup data.

12. UTILITY AND TELECOMMUNICATIONS SUPPORT: Not applicable.

Date: October 1994

LOCATION: Yuma Proving Ground, Arizona

PROJECT TITLE: ECIP Facility Energy Improvements

13. PROTECTION OF HISTORIC PLACES AND ARCHEOLOGICAL SITES: Review procedures have been implemented for this project in accordance with 36 CFR 800. The review has established that there will be no effect.

- 14. PROJECT DEVELOPMENT BROCHURE: A Project Development Brochure (PDB-1) dated October 1994 has been prepared.
- 15. ENERGY REQUIREMENTS: Not applicable.
- 16. PROVISION FOR THE HANDICAPPED: Not applicable.
- 17. REAL PROPERTY MAINTENANCE ACTIVITY ANALYSIS: Not applicable.
- 18. COMMERCIAL ACTIVITIES: This project involves replacement or modification of existing systems for energy conservation. Under these conditions, the provisions of AR 5-XX do not apply, and a "new start or expansion" is not required.

Replace Boilers with Modular Units, Building 506 - Detailed Calculations

Existing boilers each have a capacity to generate 4,315 pounds per hour of steam. Steam is used to heat hot water in heat exchangers for space heating and for domestic hot water (DHW). Steam was used previously for cooking and dishwashing in the dining facility. (Dining facility is no longer used for this purpose.)

Existing boilers are oversized for their present use. The lack of use of the dining facility and changes in use from a dormatory to office functions for part of the building causes heat load to be reduced. Additional savings in heating load are provided by the recent addition of exterior wall insulation.

Installation of smaller boilers to accommodate non-heating season heating needs will reduce losses from boiler cycling and provide heating at efficiencies only available with modern boilers.

Energy Savings Calculation

Efficiencies, comparable to those developed above, of modular boiler installation (@ Hydrotherm) is 76.6% on No. 2 Fuel Oil and 75.8% on Natural Gas/LPG. Compared to existing efficiencies and energy use:

	LPG	No 2 FO	Total
Existing Energy Use (Mil BTU/Yr)	1,496	1,615	3,111
Existing Avg. Plant Efficiency	46.5%	54.5%	50.5%
Existing Plant Load (Mil BTU/Yr)	696	880	1,576
Improved Plant Efficiency	75.8%	76.6%	-
Future Energy Use (Mil BTU/Yr)	918	1,149	2,067
Energy Savings (Mil BTU/Yr)	578	466	1,044
Energy Costs (\$/Mil BTU)	\$7.37	\$13.25	-
Energy Cost Saved (\$/Year)	\$4,262	\$6,173	\$10,435
LCC UPW Factor; N = 15 Years	19.21	17.47	Region 4, Industrial
LCC Fuel Costs Saved (\$)	\$81,866	\$107,849	\$189,715

O&M Cost Savings

One operator attends existing steam boilers a minimum of 3 hours per day, 5 days per week. Use of new HW boilers does not require operator attendance. Annual labor cost savings are calculated assuming 780 Hrs/Yr, \$22/Hr x 1.5 for benefits/OH:

\$25,740 per year saved from existing operator Assume 240 Hr/Yr maintenance is required for new boilers and for existing boilers, to be kept moth-balled.

(\$7,920) per year maintain existing & new systems

Net O&M Savings = \$17,820 per Year

LCC UPV Factor; N = 20 Years 14.74

LCC O&M Costs Saved \$262,667

New Boiler Sizing

Existing boilers are sized at 4,315 #/Hr steam production; 4,187,500 BTUH output. As shown in ECO B1 calculations, average existing plant efficiency is 50.5%. Thus, design

load per boiler is: 4.1875 / 0.505 = 8.29 Million BTUH

0.505

Building use has changed:

Fewer residents

Some rooms changed to offices

Dining facility is closed

Exterior wall insulation added to building

Roof insulation added

Significantly reduced loads resulting from these changes causes existing steam boilers to cycle frequently.

Domestic Hot Water generator loads include dining facility and residents. With a population of 200 residents and 30 gpcd of 140 Deg F Hot Water use (60 Deg F CW temperature assumed):

4.008 Million BTU/Day Load

Assume

2.004 Million BTUH Load (conservative)

Load reduction due to wall insulation: Assume U = 0.40 for wall before insulation added and U = 0.05; energy savings are: 36,000 SF Wall Area

70 - 39 Deg F 31 Deg F Delta T

390,600 BTUH load saved from Wall Insulation

Population DHW Load Reduction:

Population reduced to 50% from design:

1.002 Million BTUH Load reduction

Non-use of dining facility: Booster heater uses 185 Deg F water, steam uses in cooking kettles, dishwashing, etc, account for about:

1.5 Million BTUH Load reduction

Overall Load Reduction =

2.893 Million BTUH Total Load reduction

Assuming the original boiler plant was sized for 150% of total load, the original load for heating and DHW heating is: 5.583 Million BTUH Original DHW Load

The new, reduced load for heating and DHW is: (2 x 4.1875 MBTUH / 1.5)
Replaces existing boilers until - 2.893 MBTU =

dining facility reopened

2.691 Million BTUH New, Reduced Load

DHW and Heating Services

Install Chilled Water Temperature Reset Controls - Detailed Calculations

Introduction:

Raising the chilled water temperature, or evaporator temperature, will reduce compressor load, and thus, energy consumption. The chiller Coefficient of Performance (COP) is improved, for example, reciprocating chiller efficiency is increased by up to 5.8% for a 5 Degree increase in chilled water supply temperature.

Chiller & Refrigeration Systems Evaluated:

Chiller systems evaluated and found to be feasible for this retrofit include the following:

Bidg No.	Refrig. Tons	Remarks
506	220	Centrifugal - Water Cooled Condenser
2105 C1	125	Centrifugal - Water Cooled Condenser
2105 C5	125	Centrifugal - Water Cooled Condenser

Energy Saving Calculations:

Existing chiller performance is based on field measurements of load and power demand of partially loaded chillers and on catalog performance data.

The energy savings for chilled water reset were calculated by taking all the instances in which the outdoor ambient temperature was below 75°F and, if there was a chiller demand, raising the leaving chilled water temperature from one to five degrees. The assumption was made that in instances when the outdoor temperature was below 75°F, the chilled water temperature could be raised and still satisfy the cooling load at the same flow rate. Calculations used for developing the accompanying spread sheet and graphical analyses (See Figures 1 through 3) for each chiller follow:

Abbreviations:

BTU	British Thermal Unit	
BIU	Dimon Thermal Cinc	

BTUH British Thermal Units per Hour

KW Kilowatts (Field measurement of chiller load)

KWH Kilowatt hours

EER Energy Efficiency Ratio (BTUH out + Watts in)

Chilled Water Temperature Rise (For Saving Calculations) (°F) T.

Outside Air Temperature Rise (Field measurement) (°F) TOA Temperature Differential (Field measurement) (°F) ΔΤ

GPM Gallons per minute (Field measurement)

Ratio of Annual Hours below 75°F to measurement period hours below 75°F + 365. **Cooling Factor**

EER If(GPM x 500 x Δ T) > 0, Then: EER = BTU + (KWH/1000)

BTUH (Load) GPM x $500 \times \Delta T$

Energy Saving Calculation:

The following are calculated for 5 minute measurement periods; results are averaged or totaled, as needed, to determine savings during that time and are then extended to annual savings using the Cooling Factor.

BTUH $If(T_{OA} < 75^{\circ}F)$ and If(Load) > 0, Then:

Savings (BTUH) = Load - (500 x (Δ T - T_r) x GPM)

If(EER) > 0, Then: KW = (BTUH + EER) + 1,000

KW

KWH/Day KW x (5 Minute measurement + 60 Minutes per Hour) x Cooling Factor

KWH/Year KWH/Day x 365 Days/Year

Cooling Factor Calculation:

Bldg No.	Analysis Hr<75°F	Annual Hr<75°F	Cooling Factor
506	14.67	5,236	0.978
2105 C1	5.68	5,236	2.526
2105 C5	5.68	5,236	2.526

Annual hours below 75°F are from TM 5-785. Analysis hours below 75°F are based on field measurements.

Cost Saving Calculation:

Annual energy cost savings are based on KWH savings per year as calculated above times power cost:

Electric Energy Cost: \$ 0.0830 per KWH, including demand charges. Results are tabulated on Table 1.

Operations and Maintenance Costs:

Control systems proposed in this project will require preventive maintenance and periodic calibration. It is assumed that this will require a total of about 16 hours per year of additional O&M effort for each system.

16 MH/Yr x \$22/MH x 1.5 (Benefits & OH)

\$528 per Year added O&M Cost

Added LCC O&M Cost:

14.74 (UPW Factor) $\times $528/Yr =$

\$ 7,783 Added LCC Costs per System

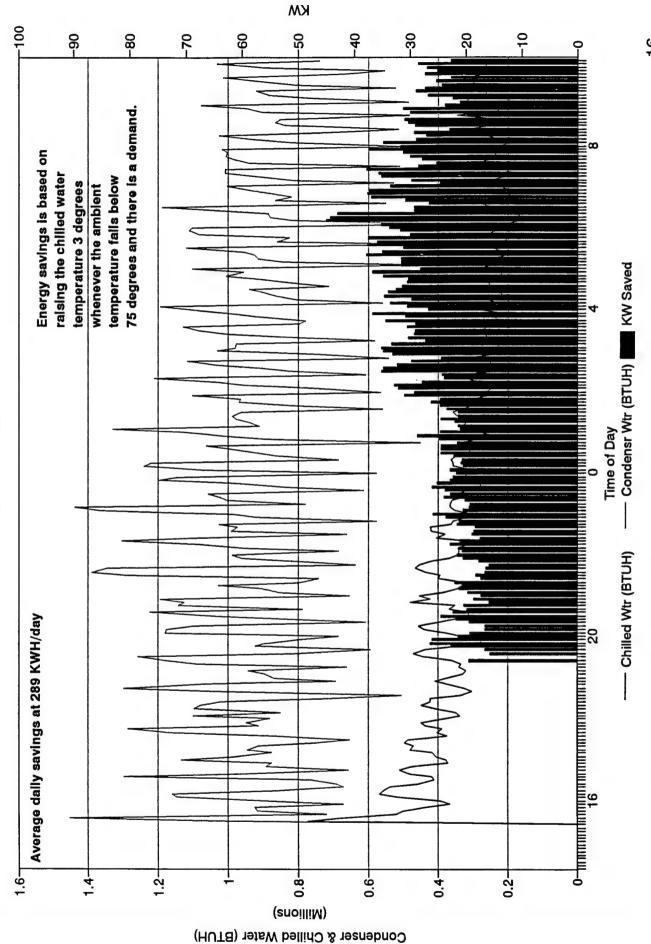

Modifications Required:

Raise chilled water temperature to "follow the load": Install a limit switch in each modulating or diversion valve to measure whether the valve is fully open or partially open. Arrange the control circuits so that when all coil control valves are either closed or in a partially open position (indicating light load conditions), the chilled-water temperature supply set point should be raised until one or more coil control valves return to the fully open position. Raise supply air temperature to follow the load. Installation costs are summarized on the attached cost estimate sheet.

Building 506 - 45 Ton Glycol Chiller Replacement - Detailed Calculations

The Glycol Chiller used for the Ice-On-Coil System is presently rated at a capacity of 45 Tons. The unit was recently converted from a standard chiller rated at 80 Tons capacity; it has been derated for colder-temperature application. Replacement of this converted chiller with one designed for cold temperature application is evaluated.

Based on manufacturer's data, the Ice-On-Coil glycol chiller provides 49.7 tons of refrigeration at 105 °F outside air temperature while drawing 103.9 kW of electric power. Newer chillers designed initially for low temperature operation can provide the same degree of cooling while drawing only 90.2 kW.

Based on daily use of 16 hours per day (20 hours per day are scheduled), year-round, savings are:

(103.9 - 90.2) kW x 16 Hours/Day x 365 Days/Year =

80,000 kWh/Year

The incremental cost of electric power is \$0.083 per kWH, thus, annual power cost savings are:

(80,000 kWH/Year x \$0.083 = \$6,640 per year saved

Life cycle energy cost savings are:

15.64 (UPW for electric power, N=20 Years) x \$6,640 =

\$103,850

Maintenance costs would be about the same as they are for the existing chiller.

The required investment is about (see attached cost estimate):

\$55,898 x 1.12 (SIOH & Design) =

\$ 62,606

The payback period is, thus:

Investment + Annual Energy Cost Savings =

9.43 Years

And the Savings to Investment Ratio (SIR) is:

\$ 103,850 (Life Cycle Cost Savings) + (Investment) \$

\$ 62,606

1.66

Manifold Building 3490 Chillers - Detailed Calculations

Building 3490, Test Evaluation Facility, is provided space cooling by three (3) air cooled chillers serving air handling units. Each of the chillers serve different parts of the building. During low load periods all three chiller systems operate near their minimum efficiencies with significant unloading.

Installation of piping and controls to combine the three systems into a single system will allow low load conditions to be served by only one or two compressors operating near their rated capacities. Energy savings will result because compressors operate more efficiently at rated capacities than in unloaded conditions.

Replacing the rooftop cooling unit serving the Electronics Room in the Gun Shop with a chilled water fan coil unit will save additional energy.

Energy Saving Calculations:

Data collected for about a 24 hour period in October 1993:

- . Cooling load measurements BTUH of chilled water from each chiller
- kW Power consumption measurements for each chiller
- Outside dry-bulb air temperature measurements
- Manufacture's data on chillers and compressors

Assumptions:

- Chillers operate at peak capacity during hottest observed temperatures in TM 5-785 Bin data
- 2. For peak temperature operations, chiller performance data at 105 °F dry-bulb applies.
- 3. Measured performance data (power use and thermal load) applies to measured outdoor temperatures.

Existing System Annual Power Usage Estimate

Chillers are manufactured by Webster, now out of business. Available catalog data lists the following for 105°F and 45°F LWT; Copeland compressor data for 50% loading:

Chiller	Model	Unloading	Tons	kW	100% EER	50% EER
Chiller 1	CPK-26A	100, 50, 0	17.6	21.3	9.92	9.23
Chiller 2	CPK-51A	100,75,50,25,0	35.1	42.1	10.00	9.31
Chiller 3	CPK-100A2	100,75,50,25,0	66.5	93.1	8.57	7.98

Chillers are loaded as shown on Figures 1 and 2. Existing energy usage is determined based on measurements:

Measurement period power usage by Chillers 1, 2 and 3: 860 kWH

Measurement period Cooling Degree-Hours: 252 Degree-Hours
Annual Cooling Degree-Hours from TM 5-785 Bin Data: 109,474 Degree-Hours

Estimated annual power use of existing Chillers 1, 2 & 3:

Measurement Period kWH x Annual Deg-Hours ÷ Measurement Period Deg-Hours = 373,923 kWH/Year

Estimated annual power usage of Electronics Room Rooftop type cooling unit:

Unit size, about 5 Tons, energized continuously = 43,800 kWH/Year

Proposed System Annual Power Usage Estimate

The proposed system of manifolding chillers will provide for operations usually near one of the chiller's full load operating point, thus, more efficiently. Based on manufacturer data for full load operation at each of the temperature bins, future energy consumption is estimated at:

Outside

Air				Domestra
Temp	Total Chiller	Bin Hours	Cooling	Remarks
۰F	kW	/Year	kWH/Yr	
105	158.9	282	44,810	Maximum load, all chillers at 100%
100	133.1	398	52,954	Chiller 1 off, Chillers 2 & 3 at 100%
95	110.5	512	56,576	Chiller 2 off, Chillers 1 & 3 at 100%
90	65.9	641	42,258	Chillers 1 & 2 off, Chiller 3 on 75%
85	53.8	845	45,419	Chillers 2 off, Chillers 1 & 3 at 50%.
80	41.9	829	34,735	Chillers 1 & 3 off, Chiller 2 at 100%.
75	30.1	761	22,887	Chillers 1 & 3 off, Chiller 2 at 75%
70	21.2	784	16,621	Chillers 2 & 3 off, Chiller 1 at 100%
65	19.6	815	8,639	Chillers 2 & 3 off, Chiller 1 at 50%
60	0.0	802	-	
Total			324,898	kWh/Year

Savings from replacing Gun Shop Electronics Room Rooftop type Cooling Unit:

43,800 kWh/Year

Total Savings = 92,825 kWh/Year \$ 0.083 /kWH = \$ 7,704 /Year

Operations & Maintenance Costs:

Manifolding of chiliers involves installation of controls, piping and fittings, including control valves. Annual O&M labor to maintain these additional building components is estimated to require about 40 MH. Assuming a labor rate of \$22 per hour, plus 50% for overhead and fringe benefits, additional yearly O&M cost is:

40 MH x \$22 / MH x 1.5 = \$1,320 per year added O&M cost

Economic Evaluation Results:

This option was found cost effective with a payback period of about 9 years, and a savings to investment ratio of 1.76.

Duty Cycling Controls - Detailed Calculations

Installing a programmable controller to turn off the chillers 10 minutes per hour during peak electrical demand periods will save demand and penalty charges by the Western Area Power Authority (WAPA). Yuma Proving Ground is charged \$1.98 per kW-Month. This is a very low demand charge compared to commercially available power supplies, however, a penalty of 10 times this rate is charged whenever power demand exceeds YPG's allocation. The allocation is presently exceeded several times per year. Energy cost savings, thus, assume one excursion per year.

All chiller systems surveyed were considered; only two buildings' chiller systems are included: building 451, the Cactus Club and building 3490, the Test Evaluation Facility.

Building 506, the Enlisted Persons Barracks, is excluded from this project because its chiller system is already fitted with an electrical demand limiting system: the Ice-On-Coil system. The Ice-On-Coil system operates in recovery mode (cooling from stored ice) during the peak electrical demand period; no compressors are normally operated during these periods.

Building 2105, the Range Operations Center is not included because it houses critical mission operations consisting of extensive computer systems. Additionally, the building cooling system is served by a solar-assisted absorption cooling system which is operated during the peak demand periods.

Building 3482, the Test Preparation Facility, is an explosives assembly building and must have uninterrupted air conditioning services for safety reasons. Building 3510 is an Explosives Storage Magazine and must have uninterrupted air conditioning service for the same reason. These buildings are not included in the duty cycling control project.

Calculations result in a combined SIR of 2.49. The retrofit is recommended for installation to allow future connection to a basewide EMCS; all building chillers not servicing critical mission requirements will have to be connected to such a load shedding system.

Energy Savings Calculation:

This project is designed to reduce charges for electrical demand during peak cost periods. No energy savings are achieved by turning chillers off for short periods, since system controls will force the chillers to "make-up" the load when they <u>are</u> operating. The chiller's connected load is divided by "6" to determine demand kW reduction. Calculations are provided on Table 1. The cost savings basis is addressed on Table 1.

Operations & Maintenance Costs:

It is assumed that O&M on each new control system will require 2 hours of maintenance annually. A labor rate of \$22 per hour, plus 50% overhead and fringe benefits is assumed.

A/C Air Cooled W/C Water Cooled DX Direct Expansion Unit

Additional O&M costs assume 2 hours maintenance per year at \$22/MH x 1.5 for OH & fringes

Demand charge savings are based on WAPA demand charge of \$1.98/kW-Mo and a penalty equal to 10 times this rate (usually experienced once or twice a year). Cost savings based on avoiding a single such occurance each year.

M	Install Switching for Assembly Rooms — Building 3482 (Total cost shown)	Control	13,589.19		

Fixture Retrofit Evaluations

Both lighting fixture modifications and replacements are considered. Most existing fluorescent fixtures use 40 watt T12 lamps and standard ballasts. (Some energy saving 34 watt lamps and energy saving ballasts are installed, but they do not predominate.)

Retrofits A, B, C and D are one-for-one lamp and ballast replacements for existing fixtures. Retrofitting existing one-lamp fluorescent fixtures with electronic ballasts and 32 watt T8 lamps will reduce fixture input power by over 20 watts in standard core and coil ballasts.

Retrofit H includes the same type of ballast and lamp replacements as above and, in addition, requires installation of a specular reflector in the fixture. This allows 4-lamp fixtures to be converted to 3-lamp fixtures without reducing illumination levels.

New fluorescent fixtures are proposed to replace existing incandescent fixtures. Retrofit types F and L are developed for this purpose.

Energy savings and economic analysis calculations for either a fixture modification or replacement are the same:

Lighting Retrofit Evaluation Calculations

Label	Contents / Calculation Explanation
RET_TYP	Retrofit type (See schedule above)
KW_SVD	(E_KW) - (S_KW) = Demand savings (kW) from lighting retrofit (See note below)
KWH_SV	(E_KWH/Y - S_KWH/Y) + [S#FXTR * SHR/WK * 52 * (EW/LAMP + EBAL_W - SW/LAMP - SBAL_W)/100000] = = Electric savings from retrofit, including cooling energy savings based on EER of 10.0
PWR_\$/Y	KWH_SVD * \$0.083 = Annual electric power cost savings (Average YPG power cost)
PWR_LCC\$	PWR_\$/Y * 12.49 = Life cycle savings, Life of 15 years; UPV factor 3.1% discount rate
CONST\$	@VLOOKUP(RET_TYP,RET_TABLE,2) = Construction cost from retrofit types schedule
SIOH	CONST\$ * 0.120 = SIOH and design at 6% each of construction cost
REBATE	(-\$8.15 * KW_SVD) = Arizona Public Services rebate for lighting retrofit kW (demand) savings for partial requirements
INVE\$T	@SUM(CONST\$,SI0H,REBATE) = Total investment per ECIP guidance
O&M_\$/Y	[@VLCOKUP(EL_TYPE,OLD,4) * EHR/WK * EL/FXTR * E#FXTR] - [@VLOOKUP(SL_TYPE,NEW,4) * SHR/WK * SL/FXTR * S#FXTR] = = Annual O&M savings (additional cost) for lamp replacements; refer to schedules OLD* and *NEW*
O&M_LC	(O&M_\$/Y * 11.85) = Life cycle O&M cost for Life of 15 years; UPV factor 3.1% discount rate
TOT_\$/Y	(O&M_\$Y + PWR_\$/Y) = Total annual cost savings
TOT_LCC\$	(O&M_LCC\$ + PWR_LCC\$) = Total life cycle cost savings
SIR	(TOT_LCC\$) / (INVE\$T) = Savings-to-investment ratio
PAYBCK	(INVE\$T) / (TOT_\$/Y) = Payback period (years)
Notage	

Notes:

Parameters shown above for existing and retrofit (savings) cases are indicated by prefixes: "E_" and "S_" respectively, corresponding to labels used above to explain lighting energy use calculations.

RET_TABLE refers to unit costs of various retrofits as summarized above. OLD and NEW refer to relamping costs as are summarized below.

Electric energy savings of proposed retrofits includes consideration of reduced space cooling demand due to lower heat rejection rates of lighting fixtures after modification. Electric power savings due to reduced cooling loads are, thus:

[(Existing Fixture Watts) - (Retrofit Fixture Watts)] * 3.413 = BTUH cooling load reduction

Applying an EER of 10.0 (a fairly conservative value based on field measurements), energy savings due to reduced cooling energy requirements are:

[BTUH Load Reduction) / (10.0 * 1,000 W/kW)] * (Operating Hrs/Yr) = kWH/Year saved

Relamping Costs for Existing Fixtures (OLD)

Fixture Type	Life (Hours)	Lamp Cost	Hours per Lamp Change	Cost per Lamp-Hr (\$)
Fluorescent	20,000	1.59	0.167	0.0170
Incandescent	750	1.75	0.083	0.2929

Relamping Costs for Retrofit Fixtures (NEW)

Retrofit Type	Life (Hours)	Lamp Cost (\$)	Hours Per Lamp Change	Cost per Lamp-Hr (\$)

Controls Retrofits

Lighting control retrofits evaluated involve installing occupancy sensor switching in offices, conference rooms, bathrooms and other areas where lights are normally turned on for periods when no one is present. Two types of occupancy sensors are considered. A wall switch type sensor is the least expensive and simply replaces a small office's toggle switch. For larger offices and open areas, ceiling mounted sensors are evaluated. Ceiling mounted switches are more expensive since a relay and additional wiring are required.

Energy savings of at least 25% have been achieved in many similar retrofits according to Arizona Public Service Company. This savings level is assumed for these evaluations.

Energy and cost savings are determined using the same formulae as are shown above for lighting energy use calculations. The operating hours per week are simply factored down.

The following table summarizes the results of economic evaluations for lighting fixture and control retrofits.

SUMMARY OF BUILDING LIGHTING AND CONTROLS RETROFIT EVALUATIONS

Particular Par	Bullaing Number	Fixtures	Type	(kW)	(KW/Yr)	(\$VYC)	(\$/Yr) (LCC \$)	Cost	Design	Rebate	Invest	Saved/Yr	\$ Saved	\$/Year	\$/Year \$LCC		back

ECIP Facility Energy Improvements

U.S. Army Yuma Proving Ground Arizona

project coordinator for using service

JACK L. NIXON ENERGY COORDINATOR

functional requirements summary, PDB-1

PROJECT OBJECTIVE

The objective of this project is to reduce energy consumption and costs and reduce operating costs by implementation of the following retrofits:

- a. Replace two steam boilers with one modular hot water boiler system in Building 506.
- b. Install chilled water temperature reset controls on three chillers (one in Building 506 and two in Building 2105).
- c. Replace the converted 45-ton glycol chiller for ice-on-coil system at Building 506 with an efficient unit designed for cold temperature application.
- d. Install duty cycling controls on four chillers (one in Building 451 and three in Building 3490).
- e. Modify lighting fixtures and install lighting controls as follows:
 - (1) Retrofit fluorescent fixtures with electronic ballasts and T8 lamps in Buildings 451, 506A, 506B, 506C, 2105 and 3490.
 - (2) Retrofit 4-lamp fluorescent fixtures with 3-lamp electronic ballasts, T8 lamps and specular reflectors in Buildings 457, 506B, 2105 and 3490.
 - (3) Replace incandescent fixtures with surface mounted T8 and compact fluorescent fixtures in Buildings 451, 506A and 506B.
- f. Install occupancy sensors (ceiling or wall-switch mounted) in Buildings 451, 506A, 506B, 2105 and 3490.
- g. Install additional (explosion-proof) light fixture switching in Building 3482.
